

PHYSICS COLLOQUIA 2024

CMB spectral distortions are now recognized as a powerful probe for early universe and particle physics.

A lot of the work has focused on understanding the formation of distortions and what these could teach us about the Universe we live in.

In my talk, I will give a broad-brush overview of these developments and explain some of the emerging synergistic opportunities with CMB spectral distortions, highlighting new links to 21cm cosmology and the great potential of CMB spectral distortion anisotropies.

Jens Chluba | University of Manchester (GBR)
